Testimonial :

about the operation of a Carrier 30XA 1702 chiller with "Blue Energy" pre-cooling panels "Smart cooling".

In September 2013, pre-cooling panels manufactured by the "Blue Energy" company were installed and commissioned at a factory operated by the "Philip Morris Ukraine" PLC within the boundaries of the implementation of an energy saving program.

We have verified the actual efficiency of the usage of these panels in 2014. According to the meter readings acquired during the period of May 2014 to September 2014, the energy saved through the operation of the chiller with pre-cooling panels comprises a total of 92000 kW/h.

Considering the fact that the summer period of 2014 was not that hot, the figures regarding the operation of the chiller look very convincing. Therefore, we do plan on installing similar panels on another chiller similar to this one in 2015.

In the opinion of the experts working for the technical department of the "Philip Morris Ukraine" PLC, the "Blue Energy" pre-cooling panels "Smart cooling" are a worthy alternative to "wet" type cooling plants from the standpoint of improving the performance of a refrigeration supply system.

Respectfully yours,

Service maintenance chief engineer A.A. Piskarev

„PMU” PLC
